This report summarizes the 2015-16 influenza season in Santa Cruz County, California and the United States. Overall, the 2015-16 flu season was mild to moderate, arriving and departing relatively late.

**SANTA CRUZ COUNTY**
The Santa Cruz County Health Officer’s masking order was extended beyond March 31st to April 15th, since flu was still widespread in California at the end of March. The order states that all licensed healthcare facilities must ensure that all healthcare workers either receive an annual flu vaccine or, if they decline, wear a mask while working in patient care areas. Reportable condition numbers were similar, though slightly decreased, compared to the previous season (Table 1).

**CALIFORNIA**
The number of positive flu specimens in California peaked in late February, which is fairly late in the season (Figure 1). The majority of cases were flu B (green bar), followed by flu 2009 A (H1N1) (the orange bar); the yellow bar shows flu A results that were not sub-typed.

**UNITED STATES**
Nationally, the 2015/16 flu season peaked in mid-March, which is quite a bit later than usual, using outpatient influenza-like illness visits as the measure (Figure 2). Fortunately, antigenically characterized influenza viruses have matched the influenza components included in the trivalent and quadrivalent influenza vaccines. In February, the CDC reported preliminary overall influenza vaccine effectiveness (VE) of 59 percent, meaning getting a flu vaccine reduced the risk of having to go to the doctor because of flu by nearly 60 percent. This finding is comparable to past estimates in years when most of the circulating viruses and vaccine viruses have been similar.
